Xythos Drive for Mac connects users directly to Xythos Enterprise Document Manager (EDM) or Xythos Digital Locker (DL) from within virtually any Mac desktop authoring tool. Xythos Drive for Mac helps users to create, update and collaborate on content directly from within Xythos EDM and Xythos DL. Xythos Drive for Mac enables Finder to upload, download, and manage files, and allows Mac applications to view and edit content directly on the server just as they would view and edit content on a local hard drive. Unlike an OS X WebDAV client, Xythos Drive is designed specifically to work with the advanced content management features of Xythos EDM and DL.

Features

Leverage unique features of both platforms

Mac users benefit from Xythos content management features such as file versioning and workflow and the Xythos environment benefits from the native content access capabilities of the Mac platform, such as Cover Flow and Quick Look views. Now, Mac users can easily review graphic files and preview movies especially beneficial to those working a variety of rich media file formats.

This permits any Mac program to open and edit documents and files stored on a server as easily as if they were on the user's own computer.

Direct integration with Mac applications

Xythos Drive includes high-level collaboration features that Mac alone can't offer. Users can easily control access rights, file locking and versions and can also view a file's version history without ever having to leave the desktop environment or applications they use every day.

Enterprise-level security

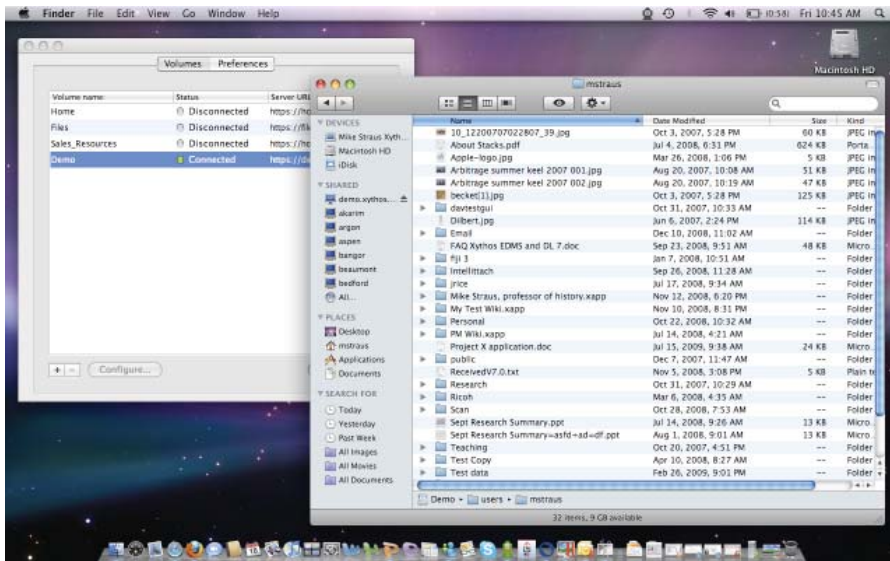

Xythos Drive supports SSL 128-bit and higher encryption or VPN access, ensuring that all file transmissions between client and server remain protected. Xythos Drive is also designed to authenticate against the server's user and group model or LDAP, helping limit content access only to those who are permitted. Authorization is maintained by the server's access control, allowing users to see only those directories to which they are permitted.
